

EXCITING INTERACTIVE IN-CAR ENTERTAINMENT

The great musician Herbert von Karajan told Enzo Ferrari that his engines produced "a burst of harmony that no conductor could ever recreate".

The sound of engine and exhaust is a vital part of the experience when driving a car. Comfort and environment requirements, however, has led to an almost complete suppression of these sounds.

SoundRacer AB has developed a special technology to sense and calculate the car engine rpm and produce the sounds of a powerful Super Sports Car.

SoundRacer brings a realistic and exciting SuperCar engine sound into your silent standard car. Just plug in the SoundRacer FM Transmitter in the 12V DC socket, turn up the volume on the car stereo and start the engine. Then the impressive sound of an idling Super Sports Car engine will fill the interior of your car. As you drive away the sound will adjust to speed, acceleration and shifting in a way that lets you feel as you were driving a real Super Sports car!

No installation, no tuning, just plug into the cigarette lighter socket, select a frequency for the car stereo receiver and turn up the volume. It's yours for only a little more than a standard FM Transmitter and your car will never be boring again!

You can also use SoundRacer to play your favorite music from an MP3 player on the car stereo.

Cleantech: More thunder with less pollution!

- Built-in FM transmitter with LED display
- Frequency range: 88.1 to 107.9 MHz
- 3,5 mm stereo plug line input (cable included)
- Transmits music from an external audio player to FM radio
- Power supply: 12V DC from cigarette lighter socket

Patent pending
